Summary

Frontend Engineer focused on building state-driven UIs with React and TypeScript. I design interfaces around clear data flow, minimal state, and predictable async behavior to keep UI logic maintainable and easy to reason about.

Skills

Frontend: React, TypeScript, JavaScript (ES6+), HTML5, CSS3

State & Architecture: State-driven UI, MVC, Derived State, Data Flow Design

API & Async: REST API integration, Typed async responses, Loading/Error handling

Tooling: Git, Responsive Design

Projects

React Portfolio — React + TypeScript | [GitHub](#) | [Live Demo](#) 2025 - 2026

- Modeled project selection using `activeProjectId` as a single source of truth, instead of boolean UI flags, to better represent user intent and avoid duplicated UI state.
- Applied derived state patterns to keep state minimal and prevent inconsistent data across components.
- Modeled async UI as a small state machine (loading / success / error) with explicit retry handling to ensure predictable behavior.

Forkify — MVC Recipe Search Application | [GitHub](#) | [Live Demo](#) 2025

- Designed a centralized application state within an MVC architecture to keep data flow predictable and easier to debug.
- Managed search, pagination, and API synchronization with explicit state updates, ensuring consistent UI behavior.
- Structured model and view separation to reduce coupling and improve maintainability.

Mapty — OOP to MVC Refactor Case Study | [GitHub](#) | [Live Demo](#) 2025

- Refactored the application from OOP to MVC architecture to improve state organization and reduce coupling between UI and logic.
- Separated domain state and UI rendering responsibilities, resulting in clearer data flow and easier feature extension.

Education

Nanhua University

Bachelor of Computer Science and Information Technology, 2024
