

Yi-Ting (Stuart) Chen

Frontend Engineer

Taiwan | Open to Remote Opportunities

[GitHub](#) | [Portfolio](#) | [LinkedIn](#) | [Email](#)

Summary

Frontend Engineer focused on building state-driven UIs with React and TypeScript. I design interfaces around clear data flow, minimal state, and predictable async behavior to keep UI logic maintainable and easy to reason about.

Skills

Frontend: React, TypeScript, JavaScript (ES6+), HTML5, CSS3

State & Architecture: State-driven UI, MVC, Derived State, Data Flow Design

API & Async: REST API integration, Typed async responses, Loading/Error handling

Tooling & Workflow: Git, AI-assisted planning/review, Documentation, Responsive Design

Projects

React Portfolio — React + TypeScript | [GitHub](#) | [Live Demo](#) 2025-2026

- Modeled project selection using `activeProjectId` as a single source of truth, instead of boolean UI flags, to better represent user intent and avoid duplicated UI state.
- Applied derived state patterns to keep state minimal and prevent inconsistent data across components.
- Modeled async UI as a small state machine (loading / success / error) with explicit retry handling to ensure predictable behavior.

Frontend Reasoning Lab — React + TypeScript | [GitHub](#) | [Live Demo](#) 2026

- Built a React + TypeScript frontend reasoning workflow covering targeted feedback, revision comparison, and bounded next-action recommendations.
- Validated AI outputs before applying them to UI state, verified the workflow end-to-end with LM Studio and OpenAI, and retained ownership of scope, data flow, validation, and final engineering decisions.

Forkify — MVC Recipe Search Application | [GitHub](#) | [Live Demo](#) 2025

- Designed centralized application state in an MVC architecture to keep API data flow predictable and easier to debug.
- Managed search, pagination, and model-view separation with explicit state updates to reduce coupling and maintain consistent UI behavior.

Mapty — OOP to MVC Refactor Case Study | [GitHub](#) | [Live Demo](#) 2025

- Refactored the app from OOP to MVC, separating domain state from UI rendering to reduce coupling and clarify data flow.

Education

Nanhua University

Bachelor of Computer Science and Information Technology, 2024
